

Vulkathunha-Gammon Ranges Geology

The Friends of are preparing a brochure to describe the region's geology. It is envisaged that both hard copy and soft copy accessible from our website, will be produced. We plan a geology map of size A1 (594 x 841 mm) covering all one side, with the reverse side comprising ~12 panels with key information in language suitable for general public along with references relevant to the map.

The approximate area to be covered is displayed below.

Photographs of interesting geology, such as the folding sediments in the image below will be included.

ASTER what does it show?

The Advanced Spaceborne Thermal Emission and Reflection Radiometer (ASTER) image of the region from a satellite, shows the regional geology as seen via the reflected/emitted “light” in 14 different wavelengths of the electromagnetic spectrum. The information contained in the image will be described.
